

TASK 7:

MICROSOFT EDGE AND BRAVE BROWSERS:

As per the task we can see that mcfree (antivirus) applications, price history, adobe pdf reader are all the applications using the browsers extension on my background.

Permission and focusing areas:

- Read your browsing history
- Manage your downloads
- Communicate with cooperating native applications
- May influence my browser
- cookies

What is extension:

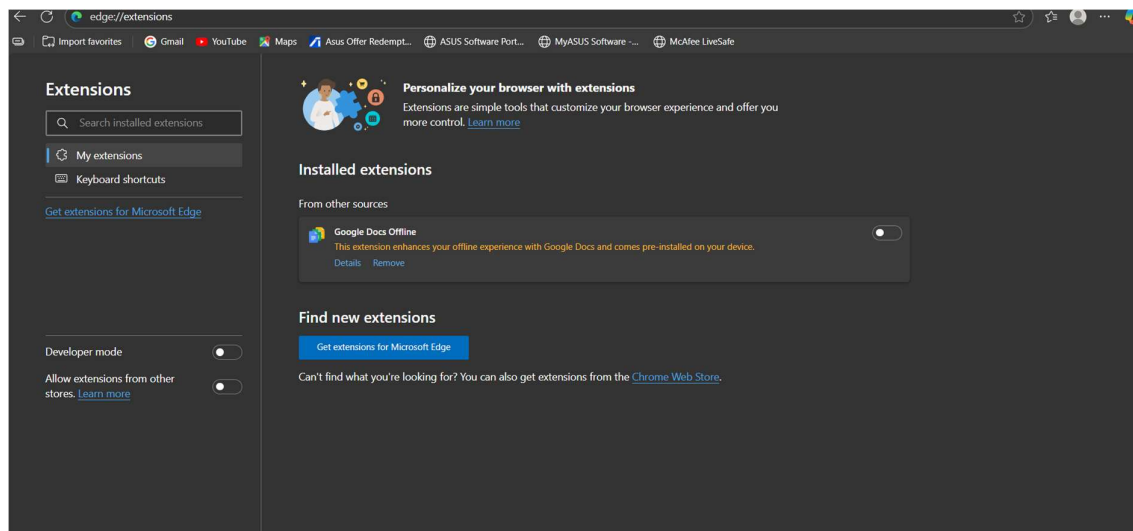

Browser extensions are small programs or add-ons that you install in your web browser (like Chrome, Edge, or Firefox) to add new features, change how things look, or improve how the browser works.

How Extensions Work

- **They act like mini-apps that run inside your browser.**
- **You can install, disable, or remove them anytime using your browser's extension manager.**
- **Some extensions just change how a website looks; others add powerful tools or automate tasks.**

COOKIES are all the sub program of extensions which is used to help the user. It is a small encrypted program and it may stored the data in device based on its type. For example password manager and etc. But it may leads to third party cookie for data theft and other things.

In my screenshot you can see that price tracker which gather my data based on my search results. And mcfree is the antivirus software which read and access my all search results and downloads to ensure I am accessing the official websites or not. And Adobe reader is my primary pdf and document viewer so it will default to open the application whenever I open any online documents. BASED on this analysis mc free and adobe reader is just user friendly to my works, but the price analyser is running to push advertisement so that I remove it form my edge.

THANK YOU.
